

Red lighting

If you get Christmas lights, you have a 99.9999% chance of getting red lights. Red lights have the ability to make you feel like it's sunset. This alerts your brain that it's getting dark, thereby triggering your sleep.

Power strip trouble

In case of a power surge, if you're lights aren't protected, you will lose the beauty. (Warning: slight chance of lights exploding in case of unprotected surge) to keep your lights running, use a power strip with surge protector to keep them up. Oh, and make sure you have spare fuses. One will break for every one surge.

Cords means problems.

There may be open cords all over the floor. To avoid making you trip, put the main cord concentration under furniture, and open cords along the walls. The cords on the light strings must not be hidden, or they will have no effect on the room.

Really brightening a room. Lighting up a room with color.

Most people sleep in darkness, but some like it bright. If you like the light on, the nightlight is too dim, and the ceiling light is too bright, consider stealing the Christmas light strings and putting them in your room. You can put them however you want, can hook up a disco ball (which looks really, really, really awesome), you can frame the doors and windows, and is great for parties. But, you'll need an extension cord or 2 or 5 or 10, you need a power strip (for switch and plugs), and cords will be all over your floor. But, heck, it's lights! All is forgiven.
